

# Kantian Characterization of Mathematics

Özge Ekin Gün, PhD.

Freie University of Berlin  
Institute of Philosophy

23 September 2016

# Outline

- ➊ Introduction
- ➋ Kant's Synthetic A priori
- ➌ Visual Reasoning in Mathematics
- ➍ Conclusion
- ➎ Outlook on Future Research

# Introduction

## Background and Motivation

### Dehumanization of mathematics and elimination of intuitions

- Discovery of geometrical or topological monsters → demonstrating unreliability of intuition

*Example:* Weierstrass' everywhere continuous but nowhere differentiable function

- Developments in modern logic → formalization of mathematics → insistence on the usage of only sentential formal representations

# Introduction

## *Importance*

Visual reasoning in mathematics with respect to Kantian characterization of mathematics

- Objective background for visual reasoning in mathematics
- Visual representations are not only psychological tools or have only heuristic usage
- Validity of Kant's characterization of mathematics as synthetic a priori

# Introduction

## *Problem*

- Many interpretations of Kantian characterization of mathematics
- Many approaches to visual reasoning in mathematics: computer generated images, epistemological, cognitive and formal

## *How to make sense of it all?*

- Meta-analysis
- Natural link between visualization and Kant's synthetic a priori

# Kant's Synthetic A priori

## *Synthetic a priori as a method*

- Not primarily truth statements in propositional forms
- Synthetic a priori method in context of justification

## *Visualization*

- External visual representations can be formalized but...
- Visualization remains (exhibiting intuition a priori in pure intuition space)

# Kant's Synthetic A priori

## *Kantian intuitions and visual representations*

Visual representations are intuitions (Anschauungen)

Not only:

- a triangle used in an Euclidean proof, drawn on a medium or visualized in mental space
- Venn diagrams

But also:

- ellipsis (...) in  $1+2+3+\dots$
- a letter symbol such as "a" representing a general property in  $a = a$  (law of identity)

$1+2+3+4+\dots$ 

## Proof by Picture

$$1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$$

$1+2+3+4+\dots$ 

## Proof by Induction

Let the property  $P(n)$  be the equation  $1 + 2 + \dots + n = n(n + 1)/2$ .

Show that the property  $P(n)$  is true for  $n = 1$ . We must show that

$1 = \frac{1(1+1)}{2}$ . The right hand side of the equation is  $\frac{1(1+1)}{2} = \frac{2}{2} = 1$ , which is the same as the left hand side. So the property is true for  $n = 1$ . Show

that for all integers  $n = k$ , if  $P(k)$  is true, then so is  $P(k + 1)$ . For the induction hypothesis, suppose  $1 + 2 + \dots + k = \frac{k(k+1)}{2}$ , for some integer  $k \geq 1$ . From this we must show that  $1 + 2 + \dots + (k + 1) = \frac{(k+1)(k+2)}{2}$ .

The left hand side of the equation can be expanded to:

$(1 + 2 + \dots + k) + (k + 1)$ . Substituting using the induction hypothesis, this is:  $\frac{k(k+1)}{2} + (k + 1)$ . Finding a common denominator and simplifying, we have:

$$\frac{k(k+1)}{2} + (k+1) = \frac{k(k+1)}{2} + \frac{(k+1) \cdot 2}{2} \quad (1)$$

$$= \frac{(k+1)(k+2)}{2} \quad (2)$$

which is what we were trying to show. QED.

$1+2+3+4+\dots$ 

## Gauss Way

$$\begin{array}{cccccccc} \sum_{i=1}^n i & = & 1 & + & 2 & + & 3 & + \dots & + & (n-2) & + & (n-1) & + & n \\ & & \downarrow & & \downarrow & & \downarrow & & & \downarrow & & \downarrow & & \downarrow \\ \sum_{i=1}^n i & = & n & + & (n-1) & + & (n-2) & + \dots & + & 3 & + & 2 & + & 1 \end{array}$$

---

$$\begin{aligned} 2 * \sum_{i=1}^n i &= (n+1) + (n+1) + (n+1) + \dots + (n+1) + (n+1) + (n+1) \\ &= n(n+1) \end{aligned}$$

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}$$

# Conclusion

## *Intuitions, Visual Representations, Mathematics*

- There is a process that helps one to look at the general complicated representation in a simplified particular way
- Any representation allowing this process is a visual representation or intuition in Kantian sense

# Conclusion

## *Mathematical truths and methods*

- Although mathematics has infallible mathematical truths immune to empirical overthrow, it is practiced by human beings
- Formal sentential method is not the only way to reach mathematical truths
- Mathematical objects and methods evolve and are revisable

# Conclusion

## *Intuitions*

- Kant's characterization of mathematics can provide an objective background for visual reasoning in mathematics.
- Visual representations are not only psychological tools or have only heuristic usage.
- There is usage of synthetic a priori method in the context of justification in mathematics.
- Visual representations and intuition are indispensable in mathematics.

# Outlook in Future Research

Deciding what is valid to use in mathematics affects how it is taught and how published media appears

A Klein bottle may be parametrized by the following [equations](#):

$$\begin{aligned}x &= \begin{cases} a \cos(u) (1 + \sin(u)) + r \cos(u) \cos(v) & 0 \leq u < \pi \\ a \cos(u) (1 + \sin(u)) + r \cos(v + \pi) & \pi < u \leq 2\pi \end{cases} \\y &= \begin{cases} b \sin(u) + r \sin(u) \cos(v) & 0 \leq u < \pi \\ b \sin(u) & \pi < u \leq 2\pi \end{cases} \\z &= r \sin(v)\end{aligned}$$

where  $v \in [0, 2\pi]$ ,  $u \in [0, 2\pi]$ ,  $r = c \left(1 - \frac{\cos(u)}{2}\right)$  and  $a, b, c$  are chosen arbitrarily.

<http://planetmath.org/kleinbottle>

# Outlook in Future Research

Demanding the usage of only sentential formal methods in such visual era is incomprehensible

<https://www.vismath.eu/>

# Outlook in Future Research

## *Theory of Visual Representations:*

- Visual thinking as a form of valid reasoning in mathematics
- Visualization can be learned and improved
- Theory of visual representations as a branch of mathematics
